Unmatched development agility

Developers writing mission-critical applications need to develop and test their applications seamlessly in the very same environment where the applications will be deployed. Couchbase makes this simple because it has a cloud-native architecture and is easily deployed on any major cloud vendor.

Linear scalability

As demand changes, you can easily scale Couchbase, even across different cloud providers, with just a few clicks. You can bring up new cloud instances or remove existing ones, all with zero downtime to your database or applications.

Faster time-to-market

With the cloud as your development environment, there's no need to wait months for hardware purchases, setup, and provisioning. Couchbase enables you to develop and deploy your application to the cloud of choice quickly and with full confidence.
